### PIPERIDINE DERIVATIVES USEFUL AS CCR5 ANTAGONISTS

## 10 BACKGROUND

The present invention relates to piperidine derivatives useful as selective CCR5 antagonists, pharmaceutical compositions containing the compounds, and methods of treatment using the compounds. The invention also relates to the use of a combination of a CCR5 antagonist of this invention and one or more antiviral or other agents useful in the treatment of Human Immunodeficiency Virus (HIV). The invention further relates to the use of a CCR-5 antagonist of this invention, alone or in combination with another agent, in the treatment of solid organ transplant rejection, graft v. host disease, arthritis, rheumatoid arthritis, inflammatory bowel disease, atopic dermatitis, psoriasis, asthma, allergies or multiple sclerosis.

The global health crisis caused by HIV, the causative agent of Acquired Immunodeficiency Syndrome (AIDS), is unquestioned, and while recent advances in drug therapies have been successful in slowing the progression of AIDS, there is still a need to find a safer, more efficient, less expensive way to control the virus.

It has been reported that the CCR5 gene plays a role in resistance to HIV infection. HIV infection begins by attachment of the virus to a target cell membrane through interaction with the cellular receptor CD4 and a secondary chemokine co-receptor molecule, and proceeds by replication and dissemination of infected cells through the blood and other tissue. There are various chemokine receptors, but for macrophage-tropic HIV, believed to be the key pathogenic strain that replicates *in vivo* in the early stages of infection, the principal chemokine receptor required for the entry of HIV into the cell is CCR5. Therefore, interfering with the interaction between the viral receptor CCR5 and HIV can block HIV entry into the cell. The present invention relates to small molecules which are CCR5 antagonists.

CCR-5 receptors have been reported to mediate cell transfer in inflammatory diseases such as arthritis, rheumatoid arthritis, atopic dermatitis, psoriasis, asthma and allergies, and inhibitors of such receptors are expected to be useful in the treatment of such diseases, and in the treatment of other inflammatory diseases or conditions such as inflammatory bowel disease, multiple sclerosis, solid organ transplant rejection and graft v. host disease.

Related piperidine derivatives which are muscarinic antagonists useful in the treatment of cognitive disorders such as Alzheimer's disease are disclosed in US patents 5,883,096; 6,037,352; 5,889,006; 5,952,349; and 5,977,138.

A-M. Vandamme et al., <u>Antiviral Chemistry & Chemotherapy</u>, 9:187-203 (1998) disclose current clinical treatments of HIV-1 infections in man including at least triple drug combinations or so-called Highly Active Antiretroviral Therapy ("HAART"); HAART involves various combinations of nucleoside reverse transcriptase inhibitors ("NRTI"), non-nucleoside reverse transcriptase inhibitors ("NNRTI") and HIV protease inhibitors ("PI"). In compliant drug-naive patients, HAART is effective in reducing mortality and progression of HIV-1 to AIDS. However, these multidrug therapies do not eliminate HIV-1 and long-term treatment usually results in multidrug resistance. Development of new drug therapies to provide better HIV-1 treatment remains a priority.

As used herein, the following terms are used as defined below unless otherwise indicated.

Alkyl (including the alkyl portions of alkoxy, alkylamino and dialkylamino) represents straight and branched carbon chains and contains from one to six carbon atoms.

Alkenyl represents C<sub>2</sub>-C<sub>6</sub> carbon chains having one or two unsaturated bonds, provided that two unsaturated bonds are not adjacent to each other.

Substituted phenyl means that the phenyl group can be substituted at any available position on the phenyl ring.

Acyl means a radical of a carboxylic acid having the formula alkyl-C(O)-, aryl-C(O)-, aralkyl-C(O)-,  $(C_3-C_7)$ cycloalkyl-C(O)-,  $(C_3-C_7)$ C<sub>7</sub>)cycloalkyl-(C<sub>1</sub>-C<sub>6</sub>)alkyl-C(O)-, and heteroaryl-C(O)-, wherein alkyl and heteroaryl are as defined herein; aryl is R12-phenyl or R12-naphthyl; and aralkyl is aryl- $(C_1-C_6)$ alkyl, wherein aryl is as defined above.

Heteroaryl represents cyclic aromatic groups of 5 or 6 atoms or bicyclic groups of 11 to 12 atoms having 1or 2 heteroatoms independently selected from O, S or N, said heteroatom(s) interrupting a carbocyclic ring structure and having a sufficient number of delocalized pi electrons to provide aromatic character, provided that the rings do not contain adjacent oxygen and/or sulfur atoms. For 6-membered heteroaryl rings, carbon atoms can be substituted by R<sup>7</sup>, R<sup>8</sup> or R<sup>9</sup> groups. Nitrogen atoms can form an N-oxide. All regioisomers are contemplated, e.g., 2-pyridyl, 3-

5

10

15

20

25

30

35

pyridyl and 4-pyridyl. Typical 6-membered heteroaryl groups are pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl and the N-oxides thereof. For 5-membered heteroaryl rings, carbon atoms can be substituted by R<sup>10</sup> or R<sup>11</sup> groups. Typical 5-membered heteroaryl rings are furyl, thienyl, pyrrolyl, thiazolyl, isothiazolyl, imidazolyl, pyrazolyl and isoxazolyl. 5-Membered rings having one heteroatom can be joined through the 2- or 3- position; 5-membered rings having two heteroatoms are preferably joined through the 4-position. Bicyclic groups typically are benzo-fused ring systems derived from the heteroaryl groups named above, e.g. quinolyl, phthalazinyl, quinazolinyl, benzofuranyl, benzothienyl and indolyl.

Preferred points of substitution for 6-membered heteroaryl rings at R<sup>2</sup> are described above. When R<sup>2</sup> is a 5-membered heteroaryl group, the R<sup>10</sup> and R<sup>11</sup> substituents are preferably attached to carbon ring members adjacent to the carbon joining the ring to the rest of the molecule, and R<sup>11</sup> is preferably alkyl; however, if a heteroatom is adjacent to the carbon joining the ring to the rest of the molecule (i.e., as in 2-pyrrolyl), R<sup>10</sup> is preferably attached to a carbon ring member adjacent to the carbon joining the ring to the rest of the molecule.

Halogen represents fluoro, chloro, bromo and iodo.

Fluoro(C<sub>1</sub>-C<sub>6</sub>)alkyl represents a straight or branched alkyl chain substituted by 1 to 5 fluoro atoms, which can be attached to the same or different carbon atoms, e.g., -CH<sub>2</sub>F, -CHF<sub>2</sub>, -CF<sub>3</sub>, F<sub>3</sub>CCH<sub>2</sub>- and -CF<sub>2</sub>CF<sub>3</sub>.

A therapeutically effective amount of a CCR5 antagonist is an amount sufficient to lower HIV-1-RNA plasma levels.

One or more, preferaby one to four, antiviral agents useful in anti-HIV-1 therapy may be used in combination with a CCR5 antagonist of the present invention. The BOC protecting group is removed by treatment with an acid such as aqueous HCl or trifluoroacetic acid, and the resulting amine is coupled to an acid under standard conditions to obtain a compound of formula I or II. **Scheme 6**:

Alternatively, the ketone **1a** can be treated with HONH<sub>2</sub>·HCl under similar conditions to yield, after separation, the E- and Z-oximes. Each oxime is then treated with a base such as potassium hexamethyldisilazide in a suitable solvent such as DMF followed by treatment with an alkylating agent, e.g., CH<sub>3</sub>I, dimethylsulfate, CH<sub>3</sub>CH<sub>2</sub>I, trifluoroethyl triflate or similar electrophiles, to yield the desired O-substituted oxime.

The ketone starting material of formula **1a** can be prepared by known methods as shown in Schemes 7 and 8.

In Scheme 7, Friedel-Crafts condensation of N-trifluoroacetylisonipecotoyl chloride 17 and an aromatic group R-H in the presence of a suitable catalyst such as AICl<sub>3</sub> and optionally in a solvent such as CH<sub>2</sub>Cl<sub>2</sub> yields a ketone 18 which is converted to its ethylene ketal 19 under standard conditions. The N-trifluoroacetyl group is removed and the resulting free amine 20 is treated with N-BOC-piperidine-4-one in the presence of a dehydrating agent such as titanium isopropoxide followed by treatment with diethylaluminum cyanide to give an aminonitrile 21. The aminonitrile is treated with a grignard reagent (R<sup>1</sup>Mg-halide) such as CH<sub>3</sub>MgBr or vinylmagnesium bromide to give the alkylated product 22. The ketal is removed by treatment with aqueous acid followed by re-protection under standard conditions using BOC anhydride to give 1a.

Alternatively, 23, prepared via Wittig olefination of N-BOC-piperidone (Chen et al, Tetrahedron Lett., 37, 30 (1996), 5233-5234), is transformed to

intermediate **25** by analogy to the procedure described in Scheme 7. **25** is converted to alcohol **26** by hydroboration/oxidation. Alcohol **26** is treated with a suitable oxidant such as a mixture tetrapropylammonium perruthenate (TPAP) and N-methylmorpholine N-oxide (NMO) to give aldehyde **27**. The aldehyde is treated with an aryllithium reagent in a suitable solvent such as ether or THF and the resulting alcohol **28** is treated with an oxidizing agent such as Dess-Martin periodinane or TPAP/NMO to give the desired ketone.

Compounds of formula I or II wherein X is  $-C(R^{13})(R^{19})$ -, wherein R and R<sup>19</sup> are the same, or wherein R and R<sup>19</sup> are different are prepared according to schemes 9 and 10, respectively. The schemes are exemplified by processes wherein R and R<sup>19</sup> are each phenyl and wherein R is phenyl and R<sup>19</sup> is CF<sub>3</sub>-phenyl, respectively, but the general procedures apply to other R and R<sup>19</sup> groups.

N-BOC-4-piperidone is treated with CBr<sub>4</sub> to obtain the di-bromo compound of formula **44**, which is then treated with phenylboronic acid to obtain the BOC-protected diphenylmethylene-piperidine of formula **45**. To a solution of ketone **30** (1.5 g, 3.22 mmol) in CH<sub>3</sub>OH (50 ml) was added sodium acetate (5.0 g, 47 mmol) and *O*-Methyl hydroxylamine hydrochloride (3.26 g, 47 mmol), and the solution was stirred at RT for 24 h. The resulting mixture was then poured into aqueous NaOH and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined extracts were dried, concentrated and chromatographed to yield 1.50 g (94%) of oxime **36**, as a mixture of E and Z isomers.

To a stirred solution of oxime **36** (0.200 g, 0.380 mmol) in THF (5 ml) was added BH<sub>3</sub>•THF (1.0 M solution in THF) at 0 °C and the solution was then warmed to RT and stirred for 1 h. The reaction mixture was then cooled to 0°C and a solution of 1N KOH in CH<sub>3</sub>OH (5 ml) was added. The reaction was warmed slowly to 60°C for 2 h, cooled to RT, quenched with water and extracted with CH<sub>2</sub>Cl<sub>2</sub>. Combined organic layers were concentrated and chromatographed over silica gel (eluting with 20% EtOH/EtOAc) to afford 0.100 g (50%) of amine **37**.

To a stirred solution of amine **37** (0.015 g, 0.030 mmol) was added pyridine (0.5 ml) and ClCOOCH<sub>3</sub> (0.25 ml), and the solution was stirred overnight. It was then poured into water, extracted with EtOAc, dried, concentrated and purified by preparative chromatography to give 0.010 g of desired product **38**:  $^{1}$ H-NMR (300 MHz, CDCl<sub>3</sub>)  $\delta$  7.45 (d, 2H), 7.05-7.12 (m, 3H), 6.95 (d, 2H), 4.95 (m, 1H), 4.45 (m, 1H), 4.15 (m, 1H), 3.62 (s,

A solution of alcohol **39ab** (660 mg, 1.41 mmol), Boc-Thr(*t*-Bu)-OH (413 mg, 1.50 mmol), DEC (290 mg, 1.50 mmol) and DMAP (190 mg, 1.55 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (5 ml) was stirred overnight at RT. The reaction mixture was poured into aqueous saturated NaHCO<sub>3</sub>, extracted with CH<sub>2</sub>Cl<sub>2</sub>, and dried over Na<sub>2</sub>SO<sub>4</sub>. The residue obtained after concentration of the solvent was subjected to flash chromatography over silica gel (eluting with CH<sub>2</sub>Cl<sub>2</sub>/acetone, 9:1) to afford, in order of elution: (i) first **40a** (391 mg, 38%), as a white foam; (ii) second **40b** (391 mg, 38%), as a white foam.

To a solution of diastereoisomer **40a** (391 mg, 0.54 mmol) in CH<sub>3</sub>OH (3 ml) was added NaOH (110 mg, 2.75 mmol; 5 equiv.) and the solution was stirred at 65 °C for 3 h. The final mixture was then poured into aqueous 0.1 N NaOH and extracted with CH<sub>2</sub>Cl<sub>2</sub> to yield **39a** (Enantiomer A) (246 mg, 98%) as a white foam. (Following the same procedure, **40b** gave **39b** (Enantiomer B). **40a** gives **43a** (Enantiomer A) and **40b** gives **43b** (Enantiomer B.)).

- 5 A) Preparation of intermediate 27 (Scheme 8 ( $R^1 = CH_3$ )).
  - 1) **23** (40.0 g, 0.203 mol) is vigorously stirred in EtOAc (200 ml) and concentrated aqueous HCl (80 ml) for 1.5 h. The solution is concentrated, diluted with Et<sub>2</sub>O (300 ml) and H<sub>2</sub>O (150 ml), the aqueous layer is separated and the organic layer is extracted once with H<sub>2</sub>O (20 ml).
  - Combined aqueous layers are concentrated and the residue is dried 24 h under high vaccum to provide 26.7 g (84%) of a white solid. To this hydrochloride and N-*tert*-butoxycarbonyl-4-piperidone (43.8 g, 0.22 mol) in anhydrous CICH<sub>2</sub>CH<sub>2</sub>Cl (80 mL) with 4 Å molecular sieves, are successively added DBU (33.2 ml, 0.22 mol) and titanium(IV) isopropoxide (65.5 ml, 0.22 mol) at 0° C, the reaction mixture is allowed to warm to RT and is stirred overnight at RT. The mixture is then cooled to 0 °C and diethylaluminum cyanide, 1 N in toluene (260 ml, 0.26 mol) is added with vigorous stirring. The reaction is allowed to warm to RT and stirred an additional 3 h, after which are added CH<sub>2</sub>Cl<sub>2</sub> (300 ml), EtOAc (300 ml), and Celite (50 g). The reaction mixture is cooled to 0 °C, water (40 ml) is added slowly with vigorous stirring and, after an additional 5 min. stirring at RT,

the excess of water is guenched with Na<sub>2</sub>SO<sub>4</sub>. The final mixture is then

filtered over Celite, evaporated and subjected to flash chromatography over silica gel (eluting with Hexanes/EtOAc, 8:2), to provide 50.3 g (83%) of **24** as a colorless oil which solidifies upon standing.

- 2) To a solution of **24** (27.7 g, 90.6 mmol) in anhydrous THF (200 mL) at 0 °C is slowly added CH<sub>3</sub>MgBr 3 M in Et<sub>2</sub>O (91 ml, 3 equiv.) with vigorous stirring. After the addition, the reaction is allowed to warm to RT and stirred 3 h. The reaction is then poured into aqueous saturated NH<sub>4</sub>Cl, extracted with Et<sub>2</sub>O (4 times), washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated to give 27.1 g (100%) of **25** as a colorless oil.
- 3) To a solution of 25 (11.6 g, 39.3 mmol) in anhydrous THF (50 ml) at 0 °C is slowly added BH<sub>3</sub>·S(CH<sub>3</sub>)<sub>2</sub> 2 N in THF (14 ml, 28 mmol) and the solution is stirred 2 days at RT. The final mixture is concentrated to ca. 50 ml and slowly poured into ice-cooled EtOH/THF 1:1 (50 ml). After 15 min. at 0 °C, 50 ml of a pH 7 buffer solution are added, followed slowly by 30% H<sub>2</sub>O<sub>2</sub> aqueous solution (50 ml). The reaction mixture is stirred overnight at RT, diluted with 1 N NaOH and extracted with CH<sub>2</sub>Cl<sub>2</sub>. Combined organic layers are dried over Na<sub>2</sub>SO<sub>4</sub>, concentrated, then subjected to flash chromatography over silica gel (eluting with EtOAc/EtOH, 8:2) to yield 9.69 g (79%) of 26 as a colorless oil.
- 4) A solution of **26** (11.2 g, 35.8 mmol) and *N*-methylmorpholine *N*-oxide (4.67 g, 39.4 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (100 ml) is stirred 1 h at RT, cooled to 0 °C, and TPAP (885 mg) is added portionwise. The reaction is allowed to warm to RT and stirred 1 h. Additional *N*-methyl-morpholine *N*-oxide (1.30 g, 11 mmol) and TPAP (300 mg) are then added to drive the reaction to completion after 1 h. The reaction mixture is filtered over Celite, concentrated, then subjected to flash chromatography over silica gel (eluting with CH<sub>2</sub>Cl<sub>2</sub>/acetone, 8:2 to 7:3) to provide 5.91 g (53%) of **27** as a yellow oil.
  - B) Preparation of title compounds of Example 6.
- 1) A solution of 1-bromo-4-(trifluoromethoxy)-benzene (4.20 ml, 28.0 mmol) in anhydrous THF (100 mL) is cooled to -78 °C and n-BuLi 2.5 N in hexanes (11.2 ml, 28.0 mmol) is added via syringe. The reaction mixture is allowed to warm to -50 °C for 10 min, cooled to -78 °C, and a solution of aldehyde **27** (6.20 g, 20.0 mmol) in anhydrous THF (15 ml) is added dropwise. After stirring 30 min at -78 °C, then 30 min at -20 °C, the solution is poured into half-brine and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 x 100 ml). Combined organic layers are dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated to give 8.85 g (94%) of an alcohol as a yellow oil.

- 2) To a solution of the product of step 1 (8.85 g, 39.3 mmol) in  $CH_2CI_2$  (100 ml) at 0 °C is added Dess-Martin periodinane (19.70 g, 2.5 equiv.) and the reaction mixture is stirred 2 h at RT. An additional 8.0 g of Dess-Martin periodinane is added and the reaction is stirred for an additional
- 5 4 h. The solution is poured into a 1:1 mixture of aqueous saturated NaHCO<sub>3</sub> and aqueous saturated Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> (200 ml), stirred 10 min, extracted with CH<sub>2</sub>Cl<sub>2</sub>, and dried over Na<sub>2</sub>SO<sub>4</sub>. The residue obtained after concentration of the solvents is purified by flash chromatography over silica gel (eluting with hexanes/EtOAc, 7:3) to yield 5.48 g (63%) of the ketone as a yellow oil.
  - A solution of the product of step 2 (2.85 g, 6.05 mmol), HONH<sub>2</sub>·HCl (2.08 g, 30 mmol), and AcONa (2.46 g, 30 mmol) in EtOH (50 mL) is heated at reflux under N<sub>2</sub> for 4 h. After evaporation of the solvent, the residue is taken up in aqueous 0.1 N NaOH and extracted with CH<sub>2</sub>Cl<sub>2</sub>.
- The residue obtained after evaporation of the solvents is subjected to flash chromatography over silica gel, to afford first the E-hydroxime (eluting with CH<sub>2</sub>Cl<sub>2</sub>/EtOAc, 7:3; 0.84 g; 29%), then the Z-hydroxime (eluting with CH<sub>2</sub>Cl<sub>2</sub>/EtOAc 1:1; 1.10 g; 37%), both products as white solids.
- 4) To a suspension of Z-hydroxime (0.89 g, 1.84 mmol) in anhydrous DMF (5 ml) is slowly added KHMDA 0.5 N in toluene (4.0 ml, 2.02 mmol) at 0 °C, leading to the appearance of a yellow solution. After 2 min. at this temperature, dimethylsulfate (350 μl, 3.7 mmol) is slowly added and the solution is allowed to warm to RT and stirred 1 h. The mixture is poured into aqueous 0.1 N NaOH, extracted with CH<sub>2</sub>Cl<sub>2</sub>, and dried over Na<sub>2</sub>SO<sub>4</sub>.
- The residue obtained after concentration of the solvents is purified by flash chromatography over silica gel (eluting with hexanes/EtOAc, 75:25) to afford 0.55 g (62%) of the Z-methoxime as a slighly yellow oil.
  - 5) A solution of Z-methoxime (0.59 g, 1.18 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (6 ml) and TFA (3 ml) is stirred 1 h at RT. After concentration, the residue is taken up in aqueous 1 N NaOH, extracted with CH<sub>2</sub>Cl<sub>2</sub>, dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated to give 0.47 g (100%) of the free amine as a white foam.

6) A solution of the product of step 5 (470 mg, 1.18 mmol), 2,4-dimethylnicotinic acid (220 mg, 1.45 mmol), DEC (280 mg, 1.45 mmol),
35 HOBT (243 mg, 1.80 mmol) and *N*-methylmorpholine (0.33 ml, 3.0 mmol) in anhydrous DMF is stirred 14 h. After concentration, the residue is taken up in aqueous 0.1 N NaOH, extracted with CH<sub>2</sub>Cl<sub>2</sub>, and dried over Na<sub>2</sub>SO<sub>4</sub>. The residue obtained after concentration of the solvent is purified by flash

step B-3. The resulting crude mixture of Z- and E-methoximes is separated on a preparative silica gel TLC plate (eluting with hexanes/ EtOAc, 80:20) to afford, in order of elution, first the E-methoxime (175 mg; 29%), then the Z-methoxime (175 mg; 29%), both products as oils.

2) The Z-methoxime (75 mg; 0.15 mmol) of step 1 is deprotected following conditions similar to those shown in Example 6, step B-5 and the resulting free amine (46 mg) is directly subjected to amidation with 2,4-dimethylnicotinic acid using conditions similar to those shown in Example 6, step B-6 to yield 50 mg (82%) of a colorless oil.

   1.07 mmol) in DMF (25 ml) is added sodium methylmercaptide (0.113 g,
   1.62 mmol) and the mixture is heated to 70° C for 12 h. The reaction mixture is then cooled to RT, diluted with Et<sub>2</sub>O, washed with brine, dried and concentrated to yield 0.437 g (97%) of sulfide.

Dissolve the starting amine (2.0 g, 5.7 mmol) in CHCl<sub>3</sub> (57 ml; = Stock solution A  $\sim$  0.1M). Add 430  $\mu$ l of stock solution A (0.043 mmol) to a slurry of 0.25 g (~ 0.22 mmol) of resin bound cardodiimide (prepared by reacting Argopore-CI resin with 1-(3-dimethylaminopropyl)3-ethyl carbodiimide in DMF at 100 C) in DMF (2 ml) in a polyethylene SPE cartridge. To this mixture add 0.12 ml of a 1M solution of 5-methyl-3-[2chlorophenyl]isoxazole-4-carboxylic acid in DMF (0.12 mmol), HOBT (86  $\mu$ l of a 0.5M solution in DMF) and DMAP (25  $\mu$ l of a 0.05M solution in DMF). Shake this mixture for 14 h, filter and add 0.3 g of Amberlyst-15 resin (~ 1.5 mmol) to the filtrate. Shake for 1 to 2 h, filter and wash the resin twice with each of the following solvents: THF, CH<sub>2</sub>Cl<sub>2</sub> and CH<sub>3</sub>OH, then wash with THF and CH<sub>2</sub>Cl<sub>2</sub>. Treat the resin with 2M NH<sub>3</sub> in CH<sub>3</sub>OH (1 time for 30 min, and 1 time for 5 min.). Combine and concentrate the filtrates under reduced pressure to afford the title compound. N-Boc-4-piperidone (10 g, 50 mmol) and PPh<sub>3</sub> (53 g, 200 mmol) 1) were taken up in CH<sub>3</sub>CN (100 ml). The solution was cooled to 0 °C and CBr<sub>4</sub> (33 g, 100 mmol) was added to the solution at 0 °C. The solution was stirred at 0 °C for 15 min. and at 25 °C for 2 h. The following assays can be used to determine the CCR5 inhibitory and antagonistic activity of the compounds of the invention.

CCR5 Membrane Binding Assay:

A high throughput screen utilizing a CCR5 membrane binding assay identifies inhibitors of RANTES binding. This assay utilizes membranes prepared from NIH 3T3 cells expressing the human CCR5 chemokine receptor which have the ability to bind to RANTES, a natural ligand for the receptor. Using a 96-well plate format, membrane preparations are incubated with <sup>125</sup>I-RANTES in the presence or absence of compound for one hour. Compounds are serially diluted over a wide range of 0.001ug/ml to 1 ug/ml and tested in triplicates. Reaction cocktails are harvested through glass fiber filters, and washed thoroughly. Total counts for replicates are averaged and data reported as the concentration required to inhibit 50 percent of total <sup>125</sup>I-RANTES binding. Compounds with potent activity in the membrane binding assay are further characterized in seconday cell-based HIV-1 entry and replication assays.

#### HIV-1 Entry Assay:

20

25

30

Replication defective HIV-1 reporter virions are generated by cotransfection of a plasmid encoding the NL4-3 strain of HIV-1 (which has been modified by mutation of the envelope gene and introduction of a luciferase reporter plasmid) along with a plasmid encoding one of several HIV-1 envelope genes as described by Connor et al, Virology, 206 (1995), p. 935-944. Following transfection of the two plasmids by calcium phosphate precipitation, the viral supernatants are harvested on day 3 and a functional viral titer determined. These stocks are then used to infect U87 cells stably expressing CD4 and the chemokine receptor CCR5 which have been preincubated with or without test compound. Infections are carried out for 2 hours at 37 °C, the cells washed and media replaced with fresh media containing compound. The cells are incubated for 3 days, lysed and luciferase

activity determined. Results are reported as the concentration of compound required to inhibit 50% of the luciferase activity in the control cultures. HIV-1 Replication Assay:

This assay uses primary peripheral blood mononuclear cells or the stable U87-CCR5 cell line to determine the effect of anti-CCR5 compounds to block infection of primary HIV-1 strains. The primary lymphocytes are purified from normal healthy donors and stimulated *in vitro* with PHA and IL-2 three days prior to infection. Using a 96-well plate format, cells are pretreated with drug for 1 hour at 37 °C and subsequently infected with an M-tropic HIV-1 isolates. Following infection, the cells are washed to remove residual inoculum and cultured in the presence of compound for 4 days. Culture supernatants are harvested and viral replication measured by determination of viral p24 antigen concentration.

#### Calcium Flux Assay:

5

10

15

20

25

30

35

Cells expressing the HIV coreceptor CCR5 are loaded with calcium sensitive dyes prior to addition of compound or the natural CCR5 ligand. Compounds with agonist properties will induce a calcium flux signal in the cell, while CCR5 antagonists are identified as compounds which do not induce signaling by themselves but are capable of blocking signaling by the natural ligand RANTES.

# GTPyS Binding Assay (secondary membrane binding assay):

A GTP $\gamma$ S binding assay measures receptor activation by CCR5 ligands. This assay measures the binding of  $^{35}$ S labeled-GTP to receptor coupled G-proteins that occurs as a result of receptor activation by an appropriate ligand. In this assay, the CCR5 ligand, RANTES, is incubated with membranes from CCR5 expressing cells and binding to the receptor activation (or binding) is determined by assaying for bound  $^{35}$ S label. The assay quantitatively determines if compounds exhibit agonist characteristics by inducing activation of the receptor or alternatively antagonist properties by measuring inhibition of RANTES binding in a competitive or non-competitive fashion.

#### Chemotaxis Assay:

The chemotaxis assay is a functional assay which characterizes the agonist vs. antagonist properties of the test compounds. The assay measures the ability of a non-adherent murine cell line expressing human CCR5 (BaF-550) to migrate across a membrane in response to either test compounds or natural ligands (i.e., RANTES, MIP-1B). Cells migrate across the permeable membrane towards compounds with agonist activity. Compounds that are antagonists not only fail to induce chemotaxis, but are

5

10

15

also capable of inhibiting cell migration in response to known CCR5 ligands.

The role of CC chemokine receptors such as CCR-5 receptors in inflammatory conditions has been reported in such publications as <a href="Immunology Letters">Immunology Letters</a>, 57, (1997), 117-120 (arthritis); Clinical & Experimental Rheumatology, 17 (4) (1999), p. 419-425 (rheumatoid arthritis); Clinical & Experimental Immunology, 117 (2) (1999), p.237-243 (atopic dermatitis); International Journal of Immunopharmacology, 20 (11) (1998), p. 661-7 (psoriasis); Journal of Allergy & Clinical Immunology, 100 (6, Pt 2) (1997), p. S52-5 (asthma); and Journal of Immunology, 159 (6) (1997), p. 2962-72 (allergies).

In the assay to determine inhibition of RANTES binding, compounds of the invention range in activity from a Ki of 0.1 to 2000 nM, with preferred compounds having a range of activity from 0.1 to 1000 nM, more preferably 0.1 to 500 nM, and most preferably 0.1 to 100 nM. The results for preferred and representative compounds of formulas I and II in the test to determine inhibition of RANTES binding are given in the table below. In the table, "Ex. For preparing pharmaceutical compositions from the CCR5 antagonist compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active ingredient. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), Remington's Pharmaceutical Sciences, 18th Edition, (1990), Mack Publishing Co., Easton, Pennsylvania.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 10 mg to about 500 mg, preferably from about 25 mg to about 300 mg, more preferably from about 50 mg to about 250 mg, and most preferably from about 55 mg to about 200 mg, according to the particular application.

The actual dosage of CCR5 compound employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total daily dosage may be divided and administered in portions during the day as required.

The amount and frequency of administration of the CCR5 compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended daily dosage regimen for oral administration can range from about 100 mg/day to about 300 mg/day, preferably 150 mg/day to 250 mg/day, more preferably about 200 mg/day, in two to four divided doses.

The doses and dosage regimens of the NRTIs, NNRTIs, PIs and other agents used in combination with the CCR5 antagonists will be determined by the attending clinician inview of the approved doses and dosage regimens in the package inserts or as set forth in the protocols, taking into consideration the age, sex and condition of the patient and the severity of the condition treated.

The goal of the HIV-1 therapy of the present invention is to reduce the HIV-1-RNA viral load below the detectable limit. The "detectable limit of HIV-1-RNA" in the context of the present invention means that there are fewer than about 200 to fewer than about 50 copies of HIV-1-RNA per ml of plasma of the patient as measured by quantitative, multi-cycle reverse transcriptase PCR methodology. HIV-1-RNA is preferably measured in the present invention by the methodology of Amplicor -1 Monitor 1.5 (available from Roche Diagnsotics) or of Nuclisens HIV-1 QT -1.

While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.
